

Device for removal of slag from hot-rolled strip contains the bath with liquid medium, the roller located above it, the ultrasonic generator, exciting and reflecting waveguides. Exciting and reflecting waveguides are immersed in the bath with the liquid medium, in this case the reflecting waveguide is made in the form of a plate connected with the exciting waveguide by spring suspensions. The rollers, diameter of which by 15-25 times exceeds the thickness of the strip, are mounted with possibility of guaranteeing the bending of the strip upstream and downstream of the generator.
