

The invention relates to mining and can be used at open mining operations to prepare emulsion explosive substance (ES) and to supply it to the well. A method of preparing ready mix of the components of emulsion ES and its supply to the well is improved through intensification of the process of component mixing, with provision of homogeneity of ready mix in the well. That for mixing of the ES components of the liquid and the solid phase is performed separately in screw mixers, at that mixing of the ES components of liquid phase is performed by means of mixer with reverse direction of the screw winding. After that the ES components of liquid and solid phases are mixed in additional screw mixer with supply to the outlet from the mixer.
