

The method for producing the ionized infusions of the medicinal herbs comprises the treatment of the aqueous medium containing the herbs with the pulse current of 10-100 mA at a voltage of 1-20 kV and pulse duration of 0.01-0.1 s for 15-30 minutes. The electrodes of pure silver (99.99%) are used. The ionized infusions obtained possess the increasing therapeutic activity and provide for the prolonged storage. The time required for producing the infusions is reduced.
