

The invention relates to a pacifier, consisting of a body (1) and a shank (2). The body of the pacifier (1) is provided with a recess extending in a longitudinal direction of the pacifier. Said pacifier is configured in such a way that the recess (4), when seen from a longitudinal point of view, tapers off in an essentially flat manner, towards the free front and (1a) of the body (1) of the pacifier. Preferably, the recess (4) extends along the entire length of the pacifier (1). Preferably, the shank (2), when seen from a cross-sectional point of view, has a bent shape. The pacifier is particularly advantageous when seen from a jaw orthopedic point of view since it simultaneously pacifies and causes the infant or young child to suck in a uniform manner.
