

A device for introducing liquids into bulk or loose dry materials, in particular for making soft dough, in which in a mixing chamber (4, 24), inclined to a descent, orientated, preferably, vertically, dry materials, delivered from above and such that dropping downwards, are moistened from a nozzle (10, 27) by liquid as a pressed water jet having high speed, meeting an internal wall (5, 21, 29) of the mixing chamber and are dropped up to an outlet opening (7, 36) which arranged below. The nozzle (10, 27) is made as that mono- or multijet turning around an axle (3, 26) and is arranged coaxially to an area of the mixing chamber which is opened below (4, 24).
