

A method for installation of elements of construction on concealed hinges according to which rotary elements of hinges and parts of those are installed on base, and at rotary elements connected to those with cramps one installs the door. One rotary element of at least one cramp is placed on base closer to outer surface of closed door. To the other rotary element of this cramp one installs door with arrangement of rotary element further from the outer surface of the door. Rotary elements of the other cramp are installed in opposite way: one rotary element is placed on base further from the outer surface of closed door, and the other rotary element of the cramp is connected to the door nearer to the outer surface of the door. Hinge has at least two rotary elements that are to be installed on the door, and at least two rotary elements that are to be installed on frame. Between the rotary elements cramps are placed. The rotary elements are arranged with possibility of installation in such way as it is described in the method.
