

A farm combined unit contains a frame with supporting wheels, units of two-windrow disk soil shredders, a drag chain, a mulcher of plant and stubble remains. The mulcher is made as the first and second drums with working knives and horizontal rotary axes connected both between each other and with a drive of rotation thereof with the aid of a chain transmission. The working knives on the cylindrical surface of the first drum are made as L-like detachable plates. The knives on the cylindrical surface of the second drum are made as rectilinear plates. The working knives on the first drum are fixed immovably, and the working knives on the second drum are attached thereto hingedly with the aid of a stud. The working knives, which are made as L-like plates, have an internal rigid crosspiece connecting the bent areas of the knife between each other. On the additional transversal beam of the frame, placed between the second drum and the first row of blade cultivators, a comb is arranged, which is made as a set of vertical bent plates, the distance between which corresponds to the maximum permissible size of shredded remains of plant origin.
