

System for remote solving complicated problems in network of providers of computing services relates to information technologies, in particular to systems for calculation of complicated problems in Internet network. The system includes block for collection and processing information, server connected to client computers, block for calculation services for users. The system additionally includes block for protection of resources of supplier connected to server for reception of requests and issue of results of calculations and to block-planner of calculation processes on computing service-processors. The last ones are placed in network of provider of computing services connected to block for registration of quantity and quality of calculation implementation. Technical result is in increase of effectiveness of calculations and protection of provider of computing services against non-authorized propagation.
