

A pessary intended for treatment of cervical incompetence and applicator for attachment thereof are disclosed. The pessary is made of nickel-titanium alloy (nitinol) with shape memory effect, it has a form of double-coil spiral with beads on the edges which have diameter exceeding diameter of the spiral wire by 0.3-0.5 mm. The distance between the coils is 1-3 mm, and the coils are coated with silver layer or biodegradable polymer containing pharmacologic agent. The applicator for pessary attachment to the uterine cervix has a handle and tubular body made as cylinder with double wall filed with freezing solution and fixed on the handle. A longitudinal slot is made on the body to hold down uterine cervix when attaching the applicator body. The body has a pocket where pessary is held to prevent heating thereof at apposition with vagina wall as well as a pessary pusher which is capable for reciprocal displacement relative to the body under the action of the spring when pusher button is pressed and released.
