

The invention relates to sport, in particular to the devices which are used for training of boxers. A portable device for boxer training has an imitator of boxing-glove, mounted on resilient holders which in pairs create humeral and elbow parts of training device with possibility of hafting of it on the boxer's operating hand and its fastenings on it by the Velcro. On the ends of holders the two hydrocapsules are fastened with hydromagnetic dynamometers for the obtaining of reverse information about force of blow and force of compression of clenched fingers.
