

The invention relates to manufacturing the handles, holders of flatware and can be used in production of the knives, forks and other similar objects. A flatware with a case of holder consists of a functional working part and a stepped holder, at end step of which a detachable additional case is fastened; moreover the functional working part and holder are all-metal, and the step of holder adjoining the functional working part has oval form in the cross section, the major axis of oval is located vertically, and the end step is made in the form of a parallelepiped with rounded off faces and is equipped with lateral cylindrical catches located in the area, which adjoins the first step perpendicularly to the side of holder, and the additional case is made from elastic material with high coefficient of friction, in the case the walls of case along the perimeter are made evenly thickening toward the free end and are equipped with open-end holes, by means of which they are installed on the cylindrical catches of the end step of holder; moreover the functional working part and holder are all-metal, the external transverse dimensions of the forward section of case correspond to the external transverse dimensions of the first step of holder, in the case the free end of the case is solid with a through transverse opening and with a rounded rear end. The invention solves the following problem of increasing the operating characteristics of flatware - balance, convenience in use of the flatware, strength, reliability and wear resistance of the article, simplification of design and reduction of cost of manufacturing and assembly.
