

The invention relates to the household kitchen implements for cooking. A pot contains a container, a cover and handles fastened thereto. The pot cover is made in the form of a cap to which middle a disk is fastened with a central opening for a pipe, opposite end of which enters into an opening of truncated cone fastened to a bottom of pot. A gap for combustion products passage is provided between the cover bottom and disk and side walls of the cover and pot. The disk, pipe and truncated cone are made from optically transparent and refractory material, and the cover is made from a material with minimal heat conductance.
