

The method includes formation at equal distances one from another of operation openings in process of development operations. One fixes walls of each opening at generatrix completely through placement of perforated template with through openings on working surface of coal bed. Through those openings in chess order one performs auger coal extraction with gradual filling worked out space. Possibility is achieved to perform unmanned coal extraction with sequential filling worked-out space. Possibility is achieved to perform unmanned auger extraction of coal irrespectively of stability of side rocks, with watered beds and other out-of-balance stocks included, with decrease of coal losses and decrease of ecological load on coal-producing regions.
