

The invention relates to medicine, in particular to laboratory investigation, and can be used in clinic-laboratory practice and educational process and experimental science. Method for making bile micro-preparation includes application of drop of native bile to object plate, it is dried during 2-4 hours at 20–30°C, with fixation in formalin vapor during 2-3 hours, after that dried micro-preparation is sealed with Canada of fir balsam and glass, at that balsam is applied to object plate round dried bile drop in perimeter of glass, with end drying of micro-preparation and marking it. The invention provides increase of effectiveness of micro-preparation and its self-descriptiveness.
