

End unit for fastening mainly of containers on the flatcar contains end and side walls, a support and device for end unit fixing. For provision of the reliable securing of container on the platform it contains the first and, at least, one of the second support elements for fastening the container. In this case, the first support element is fixed, at least, from one side of the end unit in its lower part, and all support elements for fixation of the container are hingedly connected together for providing the possibility of their folding into the packet. Last support element in the packet interacts with the wall of container for guaranteeing its fixing.
