

A system for collecting a harvested product is provided. The system may include a continuously constructed flexible container for collecting the harvested product. For instance, the continuously constructed flexible container is a continuous sheet of flexible material such as plastic. A sealing device may be included within the system which is operationally coupled to the continuously constructed flexible container to allow the container to be sealed in discrete increments. Further, the system includes a traceability device operationally coupled to each of the discrete increments of the continuously flexible container to allow the harvested product included within each increment to be tracked. The use of the continuously constructed flexible container allows the harvested product to be collected continuously.
