

The invention relates to a device for dispensing liquid yeast in a bakery, including: an inner panel (2) of a refrigerated chamber (6) onto which an inner circuit (20) for the flow of liquid yeast is pre-mounted, wherein said inner circuit is intended to be connected to a liquid yeast vessel (4) and includes a pumping unit (21); an outer panel (1) of a refrigerated chamber (6) onto which a liquid yeast metering device (16) and a metering table (10) are pre-mounted, wherein said metering table is intended to receive a vessel (3) to be filled with an amount of liquid yeast metered by said liquid yeast metering device (16). Said inner panel (2) and said outer panel (1) are structured such as to be attached sandwiched onto the wall (5) of a refrigerated chamber (6) for containing said vessel (4). Said liquid yeast metering device (16) is intended to be connected, through a wall (5) of the refrigerated chamber (6), to said inner circuit (20).
