

The invention relates to a hinge assembly for a switch cabinet (100), comprising a housing-side hinge half (1) and a door-side hinge half (2), which are connected to one another such that they swivel in relation to one another, wherein the housing-side hinge half (1) has a mounting flange (3) for securing to a vertical profile (103) of a switch cabinet housing (102), as well as two hinge bolts (5) extending in a vertical direction (x), arranged at a distance (d) to one another in the vertical direction (x) and facing one another with the free ends (4) thereof, wherein the hinge bolts are accommodated in a respective bolt seat (6) of the housing-side hinge half (1), characterised in that the hinge bolts (5) are accommodated in their respective bolt seat (6) such that they cannot move at least in the vertical direction (x), and in that they protrude from the respective bolt seat (6) via their free ends (4), wherein the door-side hinge half (2) has a bolt-receiving means (7) with a vertical measurement (z) that is less than or equal to the distance (d) of the free ends (4) of the hinge bolts (5).
