

Wedge of knitting machine is used in knitted fabric machine building. The wedge has housing and wedge-like springy plate, this is attached to the housing of the wedge, and restricting element for the bend of the springy plate, this is placed in the housing and directed toward the side of the springy plate. At that, the restriction element for the bend of the springy plate is arranged as a screw with one end in square form, with ability of rotation relative to its axis, and the other end is directed toward the side of the springy plate, arranged in conical shape with the cone generatrix parallel to the inner surface of the springy plate.
