

Method for development of high benches with soft opening rocks comprises development of the rock in the face of the cut with excavator, of formation of a stable angle of the bench side, with development in a separate face the rocks close to the upper plate of the bench and with following re-excavation in the face of the bench cut. At development of the face of the bench cut angle of the side is formed as being temporarily stable, and with a lag with respect to the face of the bench cut in a separate face semi-trench is formed as the side with the temporarily stable angle.
