

Method for development of high benches includes division of the bench to sub-benches, with strengthening the upper sub-bench with respect to the lower one by the width of the safety terraces, with development of the sub-benches by cuts. To decrease the expenses for excavation of rocks the lower sub-bench is developed by a semi-cut, this is in width smaller than the cut by the width of the safety terrace; at that before loosening the rocks in the block of the upper sub-bench within its limits at the lower sub-bench one provides preliminary loosening and displacement by explosion of the rocks under the safety terrace at the whole length of the block being loosened.
