

There is proposed a multiknife shrub mower (10) for cutting vegetation and shrubs and for applying treating liquids directly from the knives on to the cut ends of the vegetation at the moment of cutting. The mower has a multitude of pairs of the knives, which are placed at a distance one from another, provides sufficient appearing of the edges of the knives for cutting vegetation at an area, the width of which is equal to the width of the tractor. The mower (10) includes an entirely closed system of applying a treating liquid, which supplies treating liquids directly onto the lower surface of the knives.
