

The invention relates to the medicine, in particular to the cardioprotective agent for treating the acute myocardial infarction, the method for its production and the method for treatment of the acute myocardial infarction. The cardioprotective agent for treating the acute myocardial infarction consists of polyvinyl pyrrolidone and quercetin taken at a 9:1 ratio. The method for its production comprises the dissolution of quercetin in the solution of polyvinyl pyrrolidone in 95% ethanol, the neutralization of the dry residue, the sterilization, the pouring of the solution into the flasks, and freeze-drying. Quercetin content in dry residue should be not less than 0.05 g. The method for treatment of the acute myocardial infarction comprises the parenteral administration of the cardioprotective agent upon its reconstitution in saline solution.
