

A composite material for superposition of rubber powder, which material contains at least one rubber-like ingredient suitable for vulcanization and at least one low-molecular additive suitable for vulcanization. For the safe chemical activation of rubber powder surface and increasing part thereof in the bulk of "fresh" rubber articles at least one oligocopolimer with diene ingredient liquid at the room temperature is rubber ingredient, and at least one acryl ester is low-molecular additive, moreover these ingredients are taken at a ratio (% by weight):

oligocopolimer	1-60
ester	40-99.
