

A gilding manual press contains a bed, a lower working plate for disposing a decorating material, disposed on the bed mentioned, a guide for the lower plate mentioned, the supporting rollers, stationary fixed to the bed, an upper heating plate with a connecting rod, which is connected to the bed by a spring, a temperature regulator for the upper plate and a stamp secured to it heating adjustment, a pressing mechanism with a lever, which is mechanically connected, in its turn, to an eccentric, motionlessly secured at a shaft. The gilding press design changing by additionally equipping it with a rolling bearing, i.e., by changing the friction of the sliding for the friction of the rolling between the connecting rod and the eccentric the effort for the pressure development decreases.
