

Invention relates to the field of metal working by pressure, namely - to the rolling equipment, and it can be used for removing of rolls from the drum of the winder of flat bar stock and its transfer, for example, into the line of vehicle. Stripper, which contains the driving cart located above the drum of winder with a clamp fixed on it, edges of which are turned downward and hingedly articulated with the S-shaped levers, containing each a supporting roller at one end, and hingedly articulated by other ends, and the locking device of S-shaped levers, in this case it is equipped with the drive of vertical displacement articulated with the clamp and fixed on the driving cart. Invention ensures the extension of technological capabilities of the stripper without limitation of the range of external diameters of rolls.
