

Method for operating a pump station for discharge of black oil products having high freezing temperature from the railway car-tanks to sea vessels and in opposite direction comprises of installation and following operating the pumps. Pump station is included to the technological block of pipeline-pump system of reloading petroleum depot. In the technological block of the pump-pipeline system of petroleum depot reserve tank for black oil products keeping is installed, with circulation heating, this is arranged with possibility of heating. Two hermetic collectors of circulation heating of freezing oil products, and the second technological line of loading black oil products, are placed in parallel to the first technological line of the black oil products loading. Technological pipelines of pipeline-pump system of reloading petroleum depot, as discharge collectors and a system of in-site technological pipelines are made hermetic, closed and separated with shutoff-control fittings to separate technological sites. Pumps and shutoff-control fittings are installed with possibility of performing reversed flow of black oil products by technological pipelines and collectors included to the pipeline-pump system.
