

Method for cleaning intraground, blocking and feeding technological pipelines of freezing oil and viscous oil products having high freezing temperature includes removal from the line of technological pipelines connected to the vessel oil and viscous oil products residues to the reservoirs for keeping black oil products by means of making pressure difference at the sites of technological pipelines by means of pump units. In the technological unit of pump- pipeline system two reservoirs for keeping displacement oil product are installed, one of those is at first empty; in parallel to the first line of technological pipelines second line is placed, with connecting it to the existing in-site pipelines and pump units. Supply connection collector is installed, with shutoff-control fittings; pressing out of the oil and viscous oil products from the lines of technological pipelines is performed, with controlling the pressing out on the base of measuring the pressed out to the empty reservoir oil product of displacement; and loading-unloading operations are carried out.
