

Pump station for discharge of black oil products with high freezing temperature from railroad car-tanks to sea vessels and in opposite direction includes pumps, technological line of unloading black oil products. Pump station is included to the set of technological block of pipeline- pump system of reloading petroleum depot. Technological block of pump-pipeline system of the petroleum depot has reserve vessel for keeping black oil products with circulation heating, this is arranged with possibility of heating, with not less than three circulation pumps of circulation pumping heated black oil product, one of those is a backup pump; two hermetic collectors of circulation heating freezing black oil product, and second technological line of loading black oil products. System of in-site technological pipelines has suction, pressure, transportation, cleaning in-site pipelines. Pump station has pump station for black oil products and circulation pump station, for heated black oil products, this has a piston pump of upper discharge of black oil products from defective railway car-tanks, and two screw cleaning pumps.
