

This invention relates to the fire-arms. A pistol has a frame with barrel, a magazine, a shock-release mechanism and a case covering those, as well as loading and unloading openings. To decrease the dimension and the weight the pistol is equipped with cartridge-chambers, a fixed stopper, which is fixed over the magazine, a pusher, which is located over the magazine from the opposite side of the unloading opening, and a movable stop located in the unloading opening. The pusher and the movable stop are kinematically connected to the shock-release mechanism.
