

A measuring jacket and a method for use thereof are proposed. The surface of measuring jacket is partitioned along vertical lines of seams, line of semi-lap and lines of shoulder seams on three main parts – left and right foreparts and back. The main parts of the jacket are partitioned along vertical and horizontal lines on separate details. Additional partitions of the jacket surface, back with its yoke and yokes of the foreparts are made along lines of shoulder seams, vertical lines of scapula convexities, centerline and lines of convexity of breasts. The main parts and their details are joined to each other along lines of partition by seaming and with aid of known fastenings with measuring tapes and guiding buckles. The measuring jacket of required size is put on woman and is adjusted to her figure. Deflection from typical measurements, sizes of darts openings are fixed by measuring tapes.
