

The device for delivering the energy impact to the living organisms and the physical objects is designed as the regular tetrahedral pyramid. The framework elements generating the lateral ribs of the pyramid contain at least one section in the shape of spiral extending to the technological sections. The latter are plain providing for the tight connection of the framework elements. The framework elements may also contain the analogous spiral sections. The pyramid of the above-mentioned design, whichever its size, is able to deliver the significant energy impact to both the living organisms and the physical objects.
