

Contraceptive has thin-wall impermeable for moisture and pathogenic organisms elastic tube with closed distal end and formation for sperm collection, intermediate zone, broadening at one side in distal section of the tube, open proximal end attached to continuous circular element, at its other side in whole perimeter screen is attached as set of sectors of circle with glue substance applied to its surface for screen fixation on skin. Value dimensions and rigidity of circular element are chosen in dimensions and functional condition of penis. Dimension of tubular section maximally corresponds to dimensions of penis at erection, behind broadened section of pipe in direction of distal ring, in whole perimeter, at outside prominent formations and bosses are placed. At distal end of the pipe, in direction towards broadened section, color and volumetric marks of type of contraceptive are placed. At whole perimeter of that section additionally at outside and inside prominent formations and bosses are placed.
