

The invention relates to the sport equipment. The complex contains the support with the suspended sport outfits. The complex contains two rotating parts with the drive allowing for the rotation in vertical and horizontal planes. The suspended outfits are connected with the support via the braces at the top and via the springs at the bottom. The braces are equipped with the "screw-nut" couple allowing for the adjustment of the length of the device. The support is square-topped at the sites of connection with the lower braces with the springs.
