

The method for treatment of vertebrogenic venous lumbosacral radiculopathy comprises influence by impulse electric current. An electropuncture of roots and stimulation of neuromuscular loin apparatus and lower extremity are additionally carried out on the lesion side in the vein phase of pulse bloodfilling with frequency, which corresponds to the frequency of affected muscle interference electromyogram, daily for 15-25 minutes. There are 15 procedures per a course. The current power for electropuncture is 100-200 microamperes, and current density for muscle electro-stimulation is 1-2 milliamperes/cm².
