

A gatherer-stitcher for printed products, which consists of folded printed sheets, contains the sections of selection parallel to each other and revolving perpendicularly to their longitudinal axis, whose saddle-type casings are executed with possibility of collection and sewing of printed sheets, and also a rotary sewing apparatus, whose star-shaped located sewing heads are executed with possibility of actuating at convergence with the sections of selection in the area of sewing. Each sewing head contains guide for wire clamps and pusher telescopically installed in it. Guides are made with possibility of fit on the printed products and are installed on the rotary holder of sewing apparatus with possibility of turning with respect to the radius of their installation from the position of advance to the position of removal and with possibility of displacement inward against the reverse effort. The trajectory of the motion of guides and one of the motion of casings intersect.
