

A deck device of roll-deck hulling machine contains a deck holder with elastic base, and an abrasive deck, which includes separate lamellar elements, which are rested on the elastic base. Elastic base is a sheet of elastic material. Deck holder is made in the form of a rigid housing, to which is fastened the sheet of elastic material, and deck - in the form of thin elastic metallic plates with abrasive coating. Moreover, the upper part of the deck in the direction of travel of the grain in the machine is fixed on the housing, and lower part is divided in the direction of the travel of grain to the lamellar elements. The invention relates to the equipment for processing of grain, namely to the devices for peeling of grain with adnate shell, for example, of buckwheat and can be used in the grain processing industry.
