

The invention relates to the area of excavators-manipulators. The bucket has the front and the back jaws that are hinged to each other, hydro-cylinders for control of front jaw that are hinged to the front and the back jaws, holders provided at the front side of the back jaw. Hinge for connection of jaws is arranged as rod fixed in holders and is equipped with bars placed at axis normally with respect to axis of the rod, at that the front jaw is hinged on pins.
