

The invention relates to the field of chemical industry, namely, to the production of roll fillers pre-impregnated by bonding agent (pregreg). A reinforcing material includes a fibrous filler impregnated with organic bonding agent. As organic bonding agent it contains a mixture of epoxy-urethane varnish UR-231 on the basis of alkyd epoxy resin with diglycol urethane hardener and epoxydiane resin at following relationship of the components of bonding agent, parts in weight:

epoxy-urethane varnish UR-231	100
70 % solution of diglycol urethane	10-25
epoxydiane resin	2-15

Fibrous filler is made from silicate, mineral threads or their combinations.
