

The invention relates to horticulture, in particular to methods of propagating a grafting material by a method for grafting and budding fruit plants. A method for maintaining an intensive mother stock and cutting garden includes planting of plants with a growing space of 4 x 1 m, pruning for 60-70 cm, autumn cutting of all regrown shoots for 5-6 buds. From the second year of vegetation, step-by-step pinching of shoots of 5,10,15 cm is carried out depending on the vegetation year of a mother stock tree, a species and a variety.
