

The invention relates to the branch of building. One penetrates trench under loam suspension, installs assemblage-mounting equipment, with feeding pipes to mounting zone, pipes are connected in sequence to each other, tests of butt joint are performed, pipes are connected to each other in sequence, one carries out test of butt joint, ready section of pipeline is moved along the trench, pipeline is steady lowered onto the bottom of the trench, loamy suspension is pumped out. Section of trench in the zone of pipe mounting is separated with protective screen, one end of first pipe is sealed, it is moved through protective screen with following displacement of ready part of pipeline, free end of the last pipe is sealed.
