

The invention relates to medicine. It may be used for fixing of the traumatized jaw single fragments for the purpose of providing of their subsequent consolidation. A bone plate comprises a cellular shaped bar with openings and hollows for placing of fastening screw heads. The transversal tangs lying in the bar are made along one of the bar at its edge. P-shaped tang is placed in the central part. There are triangular breaks along the longitudinal sides with tops on a general normal line to the longitudinal sides, and hollows are made spherical.
