

The invention relates to drawing, design and other works in different fields of science. A method includes construction by drawing instruments of plane curve lines, which is produced in the sequence, which corresponds to their definition geometric area of points equidistant from the beginning of ray and permanent distance between them from the ray or parallel to the ray on half of permanent distance, and from mutually intersection of curves, or parallel and curves, then the points are defined equidistant from the vertex of angle, which determine the passage of straight lines from the vertex of angle dividing it into equal and unequal parts.
