

Method for fastening by gluing of upholstery to mold basis, for example, from polyurethane foam, in particular for manufacture of seat pads consists in that upholstery (1) is put into molding unit of cold shaping (2) and fastened to the latter with the help of supporting frame (3). Layer of glue (4) is applied on inner walls of upholstery, then basis surface (5) is heated up to high temperature (5), said basis should cooperate with inner walls of upholstery (1). Heating is stopped after reaching given temperature and heated in such manner foam plastic (5) is applied to inner walls of upholstery (1) covered by glue (4) in order to ensure instantaneous heat transfer by direct contact with glue (4) that provides its quick hardening. Molding unit of cold shaping (2) is opened and basis (5) with upholstery (1) is removed. Main field of application of invention – manufacture of seat pads.
