

This invention relates to the method of obtaining the shaped articles, including the cardboard, which can be used in production of furniture, in house-building etc., which are obtained from the particles of the substance of plant origin. A method of manufacturing of the shaped article includes following stages: mixing a water curable binder with the vegetable particulated material to form a first mixture, moisture content of which is insufficient for cure of the binder prior placement of mixture into the mold, the feeding of the first mixture into the mold having the molding plates, in this case the molding plates and the first mixture define the phase interface, the water supply at least to the portion of mentioned interface, in this case the amount of water added to the phase interface, together with the moisture content of the first mixture is sufficient for curing of binder, and subjecting the first mixture to elevated temperatures and pressures.
