

The invention relates to the medicine and chemical-and-pharmaceutical industry, in particular to the development and production of the drugs used for therapy of the dermatoses of different etiology. The Fladex composition consists of the following ingredients (in mass. %): fladexan (1.00-2.00), medical vaseline (15.00-20.00), stearic acid (2.00-5.00), propylene glycol (10.00-18.00), emulsifier No.1 (5.00-8.00), nipagin (0.06-0.07), nipasol (0.03-0.04), purified water (the rest). The technical result attained consists in the combined effect on the lesion with broader spectrum of the therapeutic activity and adhering to the standards limiting the microbial contamination in the manufacturing process as well as in storage and transportation of the product.
