

A hand drill is made in the form of a core with the handle on the top end and a ploughshare on the bottom one. Above ploughshare on the bottom end of the core a seed container is located, and the dosing out device is made in the form of the case with input and output openings in which with an possibility of reciprocating moving the detail with the calibrated through opening is mounted, thus the opening of the detail in its one extreme position coincides with an input opening, and in the second one with outlet opening of the case.
