

The invention relates to the field of building, in particular to machines and mechanisms for detachment of frozen and strong earths. Ripper has basic machine, parallelogram suspension with trajectory-displaced executive blocks. Teeth installed in blocks with possibility of displacement in vertical. Control hydro-cylinders. Number of working beams corresponds to the layout of placement, respectively at front and rear: one-one, one-two, two-one, two-two, one-two-one, three-two, two-three, three-three.
