

The device is related to remote-control communication, especially, the advanced signal transmitting station (STS) which changes station codes during the transmission of telecommunication signalling and supports the user parts in addition to the standart features. A signal transmitting station (STS), which handles signalling messages with the station codes inside, uses operator function of data link from signalling system, signalling data link operator function and signalling network operator function that included routing operator-function and transformation facilities disposed between signalling data link operator function and routing operator function of signalling network operator function, and it is intended for transformation at least of some station codes in signalling message to other station codes.
