

Appliance for forming pipe articles of concrete mixes comprises of a fixed and movable frames, circular in projection. The movable frame rests on the fixed one through being supported by a springy support that is installed along the frames central axis. On the movable frame a core is installed, this one is centered and fixed with respect to the central axis of the springy support. In coaxial to the core position a movable frame is installed, this one is centered with respect to the core by the pallet. In the core upper part, above the center of mass of the form with the mix, a vibro-generator is installed. On the fixed frame springy gaskets are installed on telescopic supports interacting with the movable frame. Technical result is in intensification of vibration effect on the concrete mix.
